                                                                                                                                                                                                                                                                                                                                                            receptor, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor antibody can be used as an agonist differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal.
                                                                                                                                                                                                                                                                                                                                                 QVRLQQSGGGLVQPGRSLRLSCAASGFTFDDYAMHWVRQAPGKGLEWVSGMTWNSGSIGY 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       marker; cancer; drug targetting;
cific; internalisation; non-immunogenic.
                                                                                                                                         especially a human, is suffering from decreased blood cell lineages. This is useful when a mammal, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to repopulate e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, osteoarthritis, dermatological disorders, hypertension, insulin resistance, hypercholesterolaemia, hypertrigilveriation, insulin and cholelithiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to develop
                                                                                                                                                                                                                                                                                                          Length 241;
                   WSX receptor and related antibodies and ligands - used products for diagnosis and therapy, e.g. for improving haematopoiesis or for treating tumours

as vinblastine, vindesine or melphalan; ribozymes; or antisense as vinblastine, vindesine or melphalan; ribozymes; or antisense molecules. The antibodies may also be used for in vivo or in vitro detection and/or quantitation of the c-erb-2 receptor and thus diagnosis and/or localisation of cancers characterised by expression of c-erb-2. Although antibodies have previously been used to target tumour cells, then hampered by the paucity of tumour specific antibodies has been limited. The utility of prior art antibody immunogenicity, low binding affinity, and poor tumour penetration. Immunogenicity could be avoided and toxicity reduced if high affinity tumour specific human antibodies were available. However, the production of human monoclonal antibodies using conventional hybridoma technology has proven difficult. Also, most of the antibodies produced react with antigens that are also common to non-malignant cells, which makes them unsuitable for use as tumour-targetting molecules. The antibodies of the invention overcome these difficulties, as they are targetted to a function of immunogenicity as they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents an internalising humanised antibody, scFv Cl, which specifically binds to the extracellular domain of the c-erbB-2 receptor, the protein product of the HER/meu oncogene. The scFv Cl antibody binds to the epitope of the c-erbB-2 receptor that is bound by Cl antibodies. On binding the c-erbB-2 receptor, the antibody is transported into the cell. The c-erbB-2 receptor, the protein which is overexpressed by 30-50% of breast carcinomas and other adenocarcinomas, and thus provides a useful cell surface marker for specifically targetting tumour cells. The antibodies of the invention are used as tumour-targetting molecules for diagnosis and treatment. The antibodies can be attached to effector molecules. The effector molecules may include cytotoxins such as ricin, abrin or Pseudomonas exotoxin; radionuclides; ligands such as growth factors; therapeutic agents such as ricin, abrin or Pseudomonas exotoxin; such as ricin, ariches; therapeutic agents such
"Heavy chain variable region (VH) complementarity determining region. 1 (CDR1)"
                                                                                                                                                                                                                                                                                                                                                          'Light chain variable region (VL) complementarity determining region 1 (CDR1)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Gene construct sc3D6 was engineered using the variable region coding regions of the heavy and light chains of antibody 3D6, joined by a linker. The recombinant protein binds to HIV gp160. thrombopoletin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoletin to the same way and for the same indications or growth of megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating increase platelet production. They can be used for treating immunological or hematopoletic disorders, especially thrombocytopenia.

Thrombocytopenia -associated bone marrow hypoplasia (e.g. aplastic anemia following chemotherapy or bone marrow transplant) may be effectively treated with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia (HIV-induced and non HIV-induced), chronic idiopathic thrombocytopenia, congenital thrombocytopenia, thrombotic thrombocytopenia and myelodysplasia. They can also be used in e.g. myelotoxic chemotherapy for the treatment of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablative chemotherapy for the constant of solid tumours or leukaemia, myeloablatical chemotherapy for the constant of solid tumours or leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            autologous or allogeneic bone marrow transplant, myelodysplasia, idiopathic aplastic anemia, congenital thrombocytopenia, and immune thrombocytopenia. The antibodies which bind to the MuSK receptor can be used for improving neuromuscular function in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The antibodies have a longer half-life than the natural ligand for the TPO-R. Sequences AAY06713-Y06718 represent single chain FV (scFV) fragments of

The invention relates to an agonist antibody (Ab) which binds to a thrombopoletin receptor (TPO-R). The antibodies which bind the TPO-R can thrombopoletin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoletin can expect the same indications as thrombopoletin of growth of megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating immunological or hematopoletic disorders, especially thrombocytopenia. Thrombocytopenia -associated bone marrow transplant of a plastic anemia following chemotherapy or bone marrow transplant) may be effectively treated with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia, congenital thrombocytopenia, thrombocytopenia and minune thrombocytopenia, thrombocytopenia and myelodysplasia. They can also be used in e.g. myelodysplasia, and immune thrombocytopenia, myelodysplasia, myelodysplasia, thrombocytopenia, myelodysplasia, diopathic aplastic anemia, congenital thrombocytopenia, and immune thrombocytopenia. The antibodies which bind to the MuSK receptor can be used for improving neuromuscular function in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The sequences AAYOG713-YOG718 represent single chain FV (SCFV) fragments of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä

The invention provides ligands that bind specifically to a region of an animal cell polymeric immunoglobulin receptor (pigR). The pigR cleaves to produce a stalk region remaining attached to the cell and a secretory component existing in the organ of interest in several forms. The ligands of once bind to the stalk or the most abundant form of the secretory component present in the organ under physiological conditions. The ligands are useful for transporting therapeutic or diagnostic compositions into or across cells expressing pigR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically active components such as proteins, nucleic acids or detectable labels. They are used to deliver therapeutic compositions to mucosal surfaces such as the gastro-intestinal tract, respiratory system etc. in humans. They are also useful to label cells expressing pigR, e.g. to distinguish epithelial cells from a mixed cell population in pathology studies or to aid in carcinoma diagnosis (since pigR expression is reduced in carcinomas relative to normal epithelium). They can also be used to deliver veterinary compositions, especially in mammals such as farm, domestic or wild mammals or birds reared for human consumption. The present sequence represents the amino acid sequence
                                                                                                                                                                                                                                                                                                                                                          New ligands binding to a specific region of a polymeric immunoglobulin receptor, useful for transporting therapeutic or diagnostic compositions into or across cells expressing pIGR e.g. in drug delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               207

             AAB46044
                                                  The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in diagnostic, prophylactic and therapeutic procedures. The present sequence represents the single chain antibody (SCFV) that forms the seguence represents according to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

This invention describes a novel vaccine (VI) against

conformation-dependent antigens (CDA) comprising DNA (I) and/or an

antibody, or peptide which immunologically imitates CDA, is new. (I)

cancedes a region of an antidiatypic antibody (Ab2) or another peptide

which: (a) specifically binds to the binding site of an antibody (Ab1)

conformation binding molecule; and (b) immunologically minates the

initial antigen binding molecule; and (b) immunologically minates the

conformation-dependent, and has an immunogenic structure defined by a

specific spatial conformation of amino acids. (I) is used in the form

of linear or circular naked DNA and/or with a viral vector and/or

adjuvants. The products of the invention have cytostatic, virucidal,

of linear or circular naked DNA and/or with a viral vector and/or

adjuvants. The products of the invention have cytostatic, virucidal,

antibacterial and antiparasitic. The invention also describes (I) a

corresponding vaccine (V2) against antigens which are not proteins or

peptides, as defined above but which have epitopes which show an

immunogenic structure; (2) preparing (V1) and (V2); (3) human

antidiotypic antibody fragments against the MUC1-conformation epitope

having one of 31 approximately 60 residue amino acids sequences, all fully defined in the specification; (5) antidiotypic amino acid sequences, all fully defined in the specification; (6) antidiotypic amino acid sequences, all fully defined in the specification; (6) residue amino acid sequences, all fully defined in the specification; (6) residue amino acid sequences, all fully defined in the specification; (6) residue amino acid sequences, all fully defined in the specification; (6) residue amino acid sequences, all fully defined in the specification; (6) residue amino acid sequences, all fully defined in (3, 4, 5, or 6). (V1) and (V2) are used to treat

cancer, and infectious diseases, effective in cases where vaccination has

previously not been possible.
                                                                                                                                                                                                                                                                                                                                                                                       MUC1; human; vaccine; conformation-dependent antigen; antibody; cancer; antidiotypic antibody; cytostatic; virucidal; antibacterial; TF antigen; antiparasitic; infectious disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel vaccine (VI) against conformation-dependent antigens (CDA) comprising DNA (I) and/or an antibody, or peptide which immunologically imitates CDA, is new. (I) encodes a region of an antidiotypic antibody (Ab2) or another peptide which: (a) specifically binds to the binding site of an antibody (Ab1) or an antigen binding molecule; and (b) immunologically mimics the initial antigen. The epitope is partially or completely conformation-dependent, and has an immunogenic structure defined by a specific spatial conformation of amino acids. (I) is used in the form of linear or circular naked DNA and/or with a viral vector and/or adjuvants. The products of the invention have cytostatic, virucidal, antibacterial and antiparasitic. The invention also describes (1) a antibacterial and antiparasitic antigens which are not proteins or

The invention relates to an agonist antibody (Ab) which binds to a thrombopoletin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoletin or growth of case increase platelet production. They can be used for treating megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating immunological or hematopoletic disorders, especially thrombocytopenia. Thrombocytopenia - associated bone marrow transplant) may be effectively created with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia, congenital thrombocytopenia, thrombocytopenia in thrombocytopenia, thrombocytopenia, myelodysplasia. They can also be used in e.g. myelodysplasia.

CHIV-induced and non HIV-induced), chronic idiopathic thrombocytopenia, congenital thrombocytopenia, thrombocytopenia, myelodysplasia. They can also be used in e.g. myelodysplasia.

CHIV-induced and non HIV-induced), chronic idiopathic chemotherapy for myelodysplasia. They can also be used in e.g. myelodysplasia.

CHIV-induced and non HIV-induced in e.g. myelodysplasia.

CHIV-induced and non HIV-induced, thrombocytopenia and immune chrombocytopenia. The antibodies which bind to the MuSK receptor can be used for improving neuromuscular induction in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The sequences AAYO6713-Y06718 represent single chain FV (SCFV) fragments of

thrombopoletin receptor (TPO-R). The antibodies which binds to a thrombopoletin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoletin can stimulate proliferation, differentiation or growth of megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating immunological or hematopoletic disorders, especially thrombocytopenia. Thrombocytopenia -associated bone marrow transplant) may be effectively treated with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia (HIV-induced and non HIV-induced), chronic idiopathic thrombocytopenia and congenital thrombocytopenia, thrombocytopenia and myelodysplasia. They can also be used in e.g. myelodysplasia, antipogeneic bone marrow transplant, myelodysplasia, chemotherapy for autologous or allogeneic bone marrow transplant, myelodysplasia, idiopathic aplastic anemia, congenital thrombocytopenia, and immune thrombocytopenia. The mutbhodies which bind to the Musk receptor can be used for improving neuromuscular function in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The sequences AAVO6713 represent single chain FV (scFV) fragments of various antibodies.

This invention describes a novel vaccine (VI) against conformation-dependent antigens (CDA) comprising DNA (I) and/or an antibody, or peptide which immunologically initates CDA, is new. (I) encodes a region of an antidotypic antibody (Abb) or another peptide which: (a) specifically binds to the binding site of an antibody (Abl) or an antigen binding molecule; and (b) immunologically mimics the initial antigen. The epitope is partially or completely conformation-dependent, and has an immunogenic structure defined by a specific spatial conformation of amino acids. (I) is used in the form of linear or circular naked DNA and/or with a viral vector and/or adjuvants. The products of the invention have cytostatic, virucidal, antibacterial and antiparasitic. The invention also describes (I) a corresponding vaccine (V2) against antigens which are not proteins or immunogenic structure; (2) preparing (V1) and (V2); (3) human corresponding vaccine (V2) against the MUC1-conformation epitope mimics antidiotypic antibody fragments against the MUC1-conformation epitope mimics (autily defined in the specification; (4) MUC1-conformation epitope mimics specification; (5) antidiotyphic antibody fragment against the TE specification; (5) artidiotyphic antibody fragment epitope mimics the specification; (6) TF carbohydrate epitope mimetics having one of 16 9-17 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics having one of 27 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics having one of 27 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics cancer, and infectious diseases, e.g. caused by prions, viruses, bacteria and parasitles. The vaccines are effective in cases where vaccination has previously, not been neasing

This invention describes a novel vaccine (VI) against conformation-dependent antigens (CDA) comprising DNA (I) and/or an antibody, or peptide which immunologically imitates CDA, is new. (I) encodes a region of an antidiotypic antibody (Ab2) or another peptide which: (a) specifically binds to the binding site of an antibody (Ab1) or an antigen binding molecule; and (b) immunologically mimics the initial antigen. The epitope is partially or completely conformation-dependent, and has an immunogenic structure defined by a specific spatial conformation of amino acids. (I) is used in the form of linear or circular naked DNA and/or with a viral vector and/or adjuvants. The products of the invention have cytostatic, virucidal, antibacterial and antiparasitic. The invention also describes (1) a corresponding vaccine (V2) against antigens which are not proteins or peptides, as defined above but which have epitopes which show an immunogenic structure; (2) preparing (V1) and (V2); (3) human immunogenic structure; (2) preparing the MUC1-conformation epitope MUC1; human; vaccine; conformation-dependent antigen; antibody; cancer; antiidiotypic antibody; cytostatic; virucidal; antibacterial; TF antigen; antiparasitic; infectious disease. based GGGPGGGGSGGGS-DVVMTQSPSFLSAFVGDT1T1TCRASQG1YNYLAWYQQKPGKAPK LLIYAASTLQSGVPSRFSGSGSGTEFTLTISSLQPEDFGTYYCQQLISYPLTFGGGTKVE Vaccines against conformation-dependent or non-peptide antigens, on DNA encoding peptide which mimics the antigen, useful e.g. as antitumor vaccines (DELB-) DELBRUECK CENT MOLEKULARE MEDIZIN MAX Disclosure; Page 5-9; 36pp; German. having one of 31 approximately 60 residue amino acids sequences, all fully defined in the specification; (4) MUC1-conformation epitope mimics having one of 16 9-17 residue amino acid sequences, all fully in the specification; (5) antiidiotypic antibody fragments against the TF antigen having one of 24 approximately 200 residue amino acid sequences, fully defined in the specification; (6) TF carbohydrate epitope mimetics having one of 25 7-13 residue amino acid sequences, all fully defined in the specification; and (7) DNA sequences encoding the fragments and derivatives defined in (3, 4, 5, or 6). (V1) and (V2) are used to treat cancer, and infectious diseases, e.g. caused by prions, viruses, bacteria and parasites. The vaccines are effective in cases where vaccination has previously not been possible.
                                                                                                                                                                                                                                                  ä

This invention describes a novel vaccine (VI) against

conformation-dependent antigens (CDA) comprising DNA (I) and/or an

antibody, or peptide which immunologically imitates CDA, is new. (I)

encodes a region of an antiddotypic antibody (Ab2) or another peptide

which: (a) specifically binds to the binding site of an antibody (Ab1)

or an antigen binding molecule; and (b) immunologically mimics the

initial antigen. The epitope is partially or completely

conformation-dependent, and has an immunogenic structure defined by a

specific spatial conformation of amino acids. (I) is used in the form

of linear or circular naked DNA and/or whith a viral vector and/or

adjuvants. The products of the invention have cytostatic, virucidal,

antibacterial and antiparasitic. The invention also describes (I) a

corresponding vaccine (V2) against antigens which are not proteins or

peptides, as defined above but which have epitopes which show an

corresponding vaccine (V2) against the MUC1-conformation epitope

antidiotypic antibody fragments against the MUC1-conformation epitope

fully defined in the specification; (4) MUC1-conformation epitope

chaving one of 16 9-17 residue amino acid sequences, all fully in the

specification; (5) antidiotypic antibody fragments against the FF

antigen having one of 24 approximately 50 residue amino acid sequences,

fully defined in the specification; (6) FF carbohydrate epitope mimetics

chaving one of 25 7-13 residue amino acid sequences, all fully defined in

the specification; (5) antidiotypic antibody fragments against the FF

antigen having one of 27 vala residue amino acid sequences, all fully defined in

the specification; and (17) DNA sequences encoding the fragments and

the specification; and (17) NA sequences cocoding the gramming and

chaving one of 27 7-13 residue amino acid sequences, all fully defined in (17) NA sequences and encoding the gramming and encoded the specification and parasites. The vaccines are effective in cases where vaccination has any and parasity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119

conformation ubscripts a novel vaccine (vi) against conformation-dependent antigens (CDA) comprising DNA (1) and/or an antibody, or peptide which immunologically imitates CDA, is new. (I) encodes a region of an antidiotypic antibody (AD2) or another peptide which immunologically imitates CDA, is new. (I) which: (a) specifically binds to the binding site of an antibody (AD1) or an ontigen binding molecule; and (b) immunologically mimics the initial antigen. The epitope is partially or completely conformation-dependent, and has an immunogenic structure defined by a specific spatial conformation of amino acids. (I) is used in the form of linear or circular naked DNA and/or with a viral vector and/or action antipacterial and antiparasitic. The invention also describes (1) a corresponding vaccine (V2) against antigens which are not proteins or antibacterial and antiparasitic. The invention also describes (1) a corresponding vaccine (V2) against antigens which show an corresponding vaccine (V2) against which have epitopes which show an immunogenic structure; (2) preparing (V1) and (V2); (3) human completed in the specification; (4) molf-conformation epitope having one of 31 approximately 60 residue amino acids sequences, all fully in the specification; (5) antidiotypic antibody fragments against the TF antigen having one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics thaving one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics thaving one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics antigen having one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics antigen having one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope and carbor, and infectious diseases, e.g. caused by prices, vaccin
 virucidal; antibacterial; TF antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccines against conformation-dependent or non-peptide antigens, based on DNA encoding peptide which mimics the antigen, useful e.g. as antitumor vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ccine (V1) against
                                                                                                                                                                                                                                                                                                                                             EDIZIN MAX
